
Subject: DRBD freezes host since kernel stab066.x

Since the DRBD kernelmodule in stab066.x was upgraded to 8.3.4 it freezes my machine. After starting the service it says "preferably kernel and userland versions should match". Then the server is not longer reachable (no ping). The wrong version of the userland-tool shouldn't kill the connection, right?!

The last line in the logfile says:

Dec 29 23:27:56 zelos kernel: drbd: initialized. Version: 8.3.4 (api:88/proto:86-91)

nothing more...

Any hints?

Thanks
Holger
