Hi guys,

Just to tell you, my little 'vzgot' experiment reached a working stage.

I was able to run a wide range of distribution rh7.3, rh8.0, rh9, fc2 ->fc12 and Centos-4.[6,7,8], Centos-5.[2,3,4], rhel-4 on a recent unmodified kernel (2.6.31.6-162.fc12).

I was able to rpmbuild clamav on those 33 distributions, so I am confident enough about reliability (charge reached 70.0 the hardware host (a Dell-2800)).

VE network is working fine (VE yum usage is fully working).
Next step is to work on ressources contention (cgroup).

You can access the RPM
<ftp://ftp.safe.ca/pub/linux/vzgot/>
Theoretically RPM is comprehensive enough to allow you to duplicate result.

Please give me feedback.

(happy new year! for those of us being on the same time frame)
