0. This is actually your provider which should help you with that. Probably you need to buy more advanced hosting plan, with raised resource limits.

1. Swap is global for all the VEs. It is used the same way as in ordinary Linux system -- if there are not enough memory, cache gets shrunked, then some pages are swapped out.

2. OpenVZ has a system of per-VE limits and guarantees called User Beancounters. You can check the current limits and usage values in `/proc/user_beancounters` file in your VE. For more info, see OpenVZ user's guide (from <http://openvz.org/documentation/guides/>) and http://wiki.openvz.org/Resource_management
