Concerns expressed in another forum thread was about openvz kernel patch not ported to recent kernel.

Purpose of my post was to show latest kernel

(at least 2.6.31) allow to have VZ capability WITHOUT need to patch kernel.

(my goal was to be able to run many linux distribution,

oldest being rh7.3 as VZ on that kernel).

In fact there is still a small problem with /proc/kmsg

which is not (yet) virtualized, meaning container(VZ)

syslogd daemon read the SAME /proc/kmsg as the HOST /proc/mmsg.

(which cause trouble on reading kernel messages).

Linux container developer are aware about this and have

scheduled to modify kernel printk.c to resolve the issue.
