Quote:

The program written right should handle this situation somehow.

It is happening in the procs library, and actually it is irrelevant. The problem is that there are services that will not function without the resources.

When memory usage goes up, the machine should slow down, due to the use of swap, and not crash. I personally don't like this model at all. Each vps should be left to decide how much swap it wants.

Anyway, i would like to know if you will implement per vps swapping in future versions. Also, i would like to know if virtuozzo supports this particular feature.

Thanks again for your patience.
