thx for answer,

this is true, that nf_conntrack_ftp is a alias, but i think it is not loaded into the ct.

yes, the ct was restartet, after manually loading the nf_conntrack_ftp package.

and you can't set in the /etc/vz/vz.conf at the section IPTABLES, the new name of the module (nf_conntrack_ftp), because when i enter nf_conntrack_ftp to this file, than i get the error,
Warning: Unknown iptable module: nf_conntrack_ftp, skipped

i think, that the problem is, that openvz thinks, the modules name is ip_conntrack_ftp and so it looks for it, but openvz doesn't find it (because it is a alias and aliases are ignored in openvz) and so it could not be loaded.

I have looked up in the file ip_tables_matches but i haven't found the module ip_conntrack_ftp

```
root@ct101:/# cat /proc/net/ip_tables_matches
```

```
owner
```

```
owner
```

```
mac
```

```
state
```

```
helper
```

```
conntrack
```

```
conntrack
```

```
length
```

```
ttl
```

```
tcpmss
```

```
multiport
```

```
multiport
```

```
limit
```

```
tos
```

```
tos
```

```
dscp
```

```
udplite
```

```
udp
```

```
tcp
```

```
icmp
```

what can i do?
