You may want to replace the uname binary with this simple bash script:

```
#!/bin/bash

case "$1" in
'-a')
    echo "Linux $HOSTNAME 2.6.13 #1 Sat Sep 3 21:11:20 PDT 2005 i686 unknown unknown
GNU/Linux"
    ;;
'-n')
    echo "$HOSTNAME"
    ;;
'-r')
    echo "2.6.13"
    ;;
'-v')
    echo "#1 Sat Sep 3 21:11:20 PDT 2005"
    ;;
'-m')
    echo "i686"
    ;;
'-p')
    echo "unknown"
    ;;
'-i')
    echo "unknown"
    ;;
'-o')
    echo "GNU/Linux"
    ;;
*)
    echo "Linux"
esac
```

Dont forget to give it executable rights.

You may want to change the kernel version too..
