finally i've managed to run OpenVZ on Slackware 13. However only 2.6.32 kernel worked for me and i still had problems with iptables - nat table did not work:

```
# iptables -L -t nat
iptables v1.4.6: can't initialize iptables table `nat': Table does not exist
(do you need to insmod?)
Perhaps iptables or your kernel needs to be upgraded.)
```

but then i found here:
http://bugzilla.openvz.org/show_bug.cgi?id=1473
that i need to apply this patch:
<http://bugzilla.openvz.org/attachment.cgi?id=1169>
to the kernel source and recompile it.

don't know about any other serious bugs, but thankfully this patch worked for me.

if anyone needs it i can make a step by step tutorial how to make it run.
