Hi

Trying to set up VEs for ipv6.

In container:

```
# modprobe ipv6
```

```
FATAL: Could not load /lib/modules/2.6.18-164.15.1.el5.028stab068.9/modules.dep: No such file or directory
```

Do I need a new kernel? What does this error exactly says that I'm missing.

What I don't understand is that I've managed to set a tunnel up for ipv6 on the HN (with succes).

Hostnode: CentOS 5.3 64minimal 2.6.18-164.15.1.el5.028stab068.9
