Subject: VEs Low performance ?

Hello

I have a Intel Core2 Quad CPU and I configured some 2 VEs

HN with Centos 5.5 64bits e VEs whith Ubuntu 9.10 64bits

In each I run the same script that creates some temporary files on disk.

When I run this script on only one VE, the performance is good when the cpulimit is 400. The runtime is 10 seconds

If I set the cplimit = 200 the runtime is 35 seconds !

If I run in 2 VEs, with cpuunit = 250000 and cpulimit 200 the performance is very bad.

I check, using the top, that processing in each VE reaches 100%

My CPU check is

Current CPU utilization: 447332

Power of the node: 531946

The cpuunit in the HN is 26600

Are there any parameter I can change?

Some tip ?

Thanks

Renato
