Subject: Unable to boot with OpenVZ kernel

Hi,
Am a newbie to openvz so pardon me if the question is basic. Am using Fedora 12 with vmlinuz-2.6.31.5-127.fc12.i686.

I installed kernel-2.6.32-bvdeyev.1.i686.rpm using rpm -ivh as mentioned in the wiki. I followed the instructions to modify sysctl and rebooted. After reboot, it loads the bvdeyev kernel and goes onto display the fedora boot screen then it just hangs. I even tried avdeyev kernel with no luck.

Any clues on what is happening or how do I go about debugging this?

Thanks,
Nirmal
