Hi,

I'm running into a problem discussed here:
http://bugs.debian.org/cgi-bin/bugreport.cgi?bug=390404

On boot of VE with a NFS share the script /etc/network/if-up.d/mountnfs freezes apparently because it tries to connect using the venet0 device which has the ip 127.0.0.1 and obviously cannot connect to the NFS share. What it should do is bring up venet0:0 and connect trought that.

How can I change the order in which interfaces are brought up? /etc/network/interfaces says that you shouldn't edit the file
