2.6.18-194.3.1.el5.028stab069.6

I see you now have a new kernel you are testing in the stable branch that fixes some things like memory leaks. That would = bad and probably why my production server is crashing ever few days.

So I guess I don't need to work on getting a kdump now?

Anyone have any recommendations for a rock solid kernel version. Something that has been running for months under moderate to heavy usage without a hiccup. This is a production server and needs to just work.
