I've used both and they both do pretty much what you want.

Even though HyperVM is free and not really supported anymore it's still better than any other control panel out there IMHO.  Paid or free.  It has a lot of features the other ones don't.  And it works.

It does have the odd quirk but it is open sourced now so if you know a bit about php and lighttp you can pretty much deal with any problems that might come along.  That is a huge plus for the do it yourselfer out there IMHO.

Solus probably has the most potential of the paid ones.  It still cannot do a lot of things HyperVM does though.

I am using both right now.  HyperVM for offsite and testing and Solus for Production.  I am considering using HyperVM for some online production stuff.  It's not too big a deal to use both without complicating things.

One thing to keep in mind is that these are just control panels that send command lines through a GUI.  They are not really integrated with OpenVZ kernel even though they may run on the same server.  So how stable the VPS's are is almost entirely a function of how stable OpenVZ is.  So if OpenVZ is stable (which it very much is with the right kernel), any control panel you use will be stable.
