Subject: running cobbler inside a CT
Posted by olojoh1977 on Fri, 23 Jul 2010 13:58:42 GMT

Hi,

I'm having problem setting up a cobbler-server inside a container.

When I run cobbler check, I get an ouput:
[root@localhost ~]# cobbler check
httpd does not appear to be running and proxying cobbler

httpd is running and SELinux is disabled on CT0. On CTxxx /etc/selinux is not present.

On a physical server I have no problem setting up cobbler.

Thankful for any input.

Kind regards Olof
