
Subject: OpenVPN Access Server inside OpenVZ

I realize many forum posts and blog posts were written on this subject.

I recently got VPS at citynethost.com.

I can't give the version number of OpenVZ yet because it looks like the VPS went down for maintenance or something.

Anyway, the OS is Ubuntu 9.10 32-bit.

The install all goes well.

Then suddenly it complains about all kinds of iptables stuff, so I attempt to fix them with "solutions" online to no avail and even trying to install vzctl and using /etc/init.d/vzctl just says can't find vzmod.
