i've tested the exploit (http://sota.gen.nz/compat2/robert_you_suck.c) yesterday on two
openvz-kernels 2.6.24-23-openvz (ubuntu 8.04) 2.6.26-2-openvz-amd64 (debian lenny) and it
apparently didn't work ./robert_you_suck
symbol table not available, aborting!
Process finished

openvz is also mentioned in connection with this bug here:
<http://seclists.org/fulldisclosure/2010/Sep/268>

but i can't figure out what is meant by "OpenVZ Payload / GRsec bypass removed for idiots and
fame whores. (same thing right)
"

ps: i've tested the exploit on the HN not a VPS
