I found this :

As xemul said.. the VE has no concept of the difference between ram and swap. Its just "memory" at the VE level. So, your HN can have 64MB of ram and 64GB of swap. Or, your HN can have 64GB of ram and 64MB of swap. In the VE, the privvm, oomguar, vmguar are uneffected by this. Only the performance changes between the two scenarios. In either case, you can guarantee and limit each VE to an arbitrary amount of memory. This drastically differs from the conventional mem management of vmware/xen (isolation). VZ is a shared kernel model and no resources are "hard dedicated" or "hard assigned".

- not possible to give/assign/guarantee a VE XX swap and YY physical memory
- not possible to restrict a VE from using physical memory and use swap instead

Think of the VZ virtual servers like resource containers, not individual linux boxes- VZ is a shared kernel approach to virtualization.

Hope this clears it up for you.

So i a VPS have 512Mo of memory it could be RAM or SWAP ? But it's not possible to give some extra swap ?

For example apache2 need swap to working fine ..

I will see the server swaping when all my memory physic will be full used ?

Regards,  
Quentin
