Subject: OpenAFS module not loading

Hello there,

I'm testing OpenVZ and I can now install a CT0 with PXE, create the image for guests, install the needed guests and finally customize them without any manual intervention.

However I still have a problem. I'm using Scientific Linux, directly derived from RHEL5, but with few special packages more, such as OpenAFS I need to manage user accounts. There is a kernel module for it, that checks the exact name of the running kernel; as the name is changed by OpenVZ (adding "stab..."), the OpenAFS module refuses to load and I have no OpenAFS service.

I have no experience in low level Linux, about modules to allow, avoid or force to load. Can anyone tell me whether it is possible to solve that problem, and how? Thanks in advance for help.
