This looks like an old bug. After some additional testing I can say this:

the kernel panic happens, when unloading IPTables modules (e.g. by restarting or stopping the iptables service).

So I changed /etc/sysconfig/iptables-config from:

```
IPTABLES_MODULES="ip_conntrack_netbios_ns"  
IPTABLES_MODULES_UNLOAD="yes"
```

to:

```
IPTABLES_MODULES=""  
IPTABLES_MODULES_UNLOAD="no"
```

Now I can restart/stop/start IPTables in Node and CT without any problem.

What implications will this fix have to my openvz practice?
