Any plans for openvz-xen Dom0/DomU 2.6.32 kernel sources? like it was with 2.6.18. I'd tried to merge patches from xen and ovz, and even have solved all of conflicts. but it fails to build almost in the beginning with this error (my patch is attached):

CC arch/x86/kernel/pci-nommu.o arch/x86/vdso/vdso32-setup-xen.c:352:5: error: conflicting types for 'syscall32\_setup\_pages' /usr/src/xen/linux-2.6.32-openvz1/arch/x86/include/asm/elf.h :338:12: note: previous declaration of 'syscall32\_setup\_pages' was here make[2]: \*\*\* [arch/x86/vdso/vdso32-setup.o] Error 1

I've used current openvz from git and xen patches from http://code.google.com/p/gentoo-xen-kernel/downloads/list to make the patch.
