I confirm this is working no trouble..

Note:

If you have container dual stack (IPV4,IPV6)
but NOT all container on the IPV4 subnet,
you need to define a second bridge on
the host (with the IPV6 number) and container
with a second interface (eth1) attached to
the host second bridge.

Having the container set with one interface
carrying both IPV6+IPV6, but not all the container
on the same IPV4 subnet make the routing quite
unreliable.
