That makes me nervous; it can't really be used that way unless we want to say that certain controllers are fundamentally incompatible and can't be allowed to play together. For whatever my \$0.02 are worth (given the state of the US dollar, that's not a whole lot), I'd suggest keeping the current mechanism, but make it clear that it belongs to your controller. If and when another controller comes along with a need for similar functionality, somebody can worry about making it more general.
