on the other hand you can simply add all the existing iptables modules to your VPS using:

```
# vzctl set VPSID --iptables <list of all modules from vzctl man> --save
```

and enable TUN/TAP devices.as described here:  
[http://wiki.openvz.org/VPN\\_via\\_the\\_TUN/TAP\\_device](http://wiki.openvz.org/VPN_via_the_TUN/TAP_device)

These are prerequisites for Plesk. This is what different between OpenVZ and Virtuozzo. In Virtuozzo everything is prepackaged and ready to use In OpenVZ it works, but you need to know where and what to tweak But we are here to help!
