Hi, I see that 028stab081.1 has been made stable for RHEL5. It's unclear to me whether or not this fixes any CVEs. The 028stab081.1 page only lists the changes since a testing version. When I click back a few testing versions I see that some CVEs were fixed in 028stab077.1.

The 028stab077.1 page has no indication of when it was released, but the wiki history indicates the page was last changed 13 November.

I'm running 028stab070.14, which is dated 18 November. Is there an easy way to figure out if any CVEs have been fixed in the new stable version?
