Hi.
I'm wondering if you managed to get this working with
Openvz?

I am in a very similar situation. I currently have two HN's which I would like to-do active-active or clustering to enable live migrations of VM's from one HN to the other etc.

I was looking at DRBD for replication however could not find any info other than for active-failover.

If you did would you mind sharing a little more in depth re your config?!

Thanks.
Dave
