1. you should change it a bit:

it should go not this way:

+ /vz/template/debian-3.1-i386-minimal/ readonly (ro)

+ /vz/private_<vpsid>/ read/write (rw)

= /vz/private/<vpsid>/

but:

+ /vz/template/debian-3.1-i386-minimal/ readonly (ro)

+ /vz/private/<vpsid>/ read/write (rw)

= /vz/root/<vpsid>/

in this case vzquota will be calculated on real ext3 file system in /vz/private, not on unionfs which is virtual file system.

2. these messages by itself are harmless. So I suppose a real problem in your case is some "hangs". Can you describe it more? Can you take calltraces using AltSysRq-P and AltSySRq-T keys?
