Quote: Depending on the hardware, you can have up to several hundred "light" VEs on a single server.

OK, but I only read about cpu time units or cpu time in percent. But how can I determine that the VE CPU has 100 MHz and not more. Or must I calculate:
Host 3800 MHz => 100 MHz = 2,631% cputime?

I don't think thats right?!
