Subject: "reboot" inside a container stops the container

Hi,

I found out that typing "reboot" in a container halts the whole container, making it unreacheable (the container itself is not running anymore, checking with vzlist on the physical machine).

Any idea if there is another command that kills all the processes and restart the container from within a root shell on the container (yes I know that you can do that with 'vzctl restart CTID' on the HN)?

Best,

"In July 2005, after several failed attempts to legalise software patents in Europe, the patent establishment changed its strategy. Instead of explicitly seeking to sanction the patentability of software, they are now seeking to create a central European patent court, which would establish and enforce patentability rules in their favor, without any possibility of correction by competing courts or democratically elected legislators."
