Hi all,

I experienced some problems while creating a .deb file with 'fakeroot debian/rules binary' and installing it with dpkg -i.

Therefore I created a small diff file which you'll find attached to this mail.

Those are the changes I made:

- Path /var/lock/subsys does not exist on "clean" installations
Modified preinst script to create path (if not there)
Modified postrm script to remote path (only during purge)
- debian/control file was modified. vzkernel is no more dependency, because
this isn't an official packet at Debian repositories
Also I added a dependency for libc6
- src/Makefile contained an error in line 221, fixed

Hope you find the modifications useful. Keep up the great work!

Bye,

Mario Ragucci
