I've been in the sysadmin/hosting business for more than a decade now and yes, there are many variables involved in administering a server that can cause unforeseen problems. Every server is a unique environment and the situation further worsens over time.

Not wanting to experiment on a live server is understandable, that's what test servers are for. I only suggested troubleshooting further because this kind of an error seems likely to repeat itself unless properly fixed.

In my experience openvz is production ready. Point anyone who thinks differently to this forum and I'm sure we'll have an interesting discussion.
