Subject: Terminal based OVZ Administration Posted by lars.bailey on Sat, 23 Apr 2011 00:54:23 GMT

I wrote an ANSI terminal-based menu-system for administering OVZ containers, some time back. This is a re-write of the program.

It's written entirely in Linux scripting, so it should be easy to add, remove, edit, for your needs.

You can create and destroy a VPS, and supports both IPv4 and IPv6 networking.

It will automatically configure DEBIAN and REDHAT standard OS template caches.

I wanted this to be primarily a base, for someone to get started with OpenVZ, but can provide a level of advanced usage.

Drop the script on any Node server, SSH, and you are set.

Some features have been removed from the version I use, due to

third-party software requirements, but it does require SCREEN, if you want to drop to a terminal console from OVZAdmin.

This is an alpha version,and some VPS admin features are not complete.(I'm currently in the middle of IPv4-IPv6 transition,and time is not a premium)

Consider this a "test drive".

I cannot provide screen shots, as I'm using a minimal graphical environment.

Comments good or bad welcomed.

Once I come up with a good release version,I will provide.

My goal is to write a GPL web-based version.
