I wrote an ANSI terminal-based menu-system for administering OVZ containers,some time back.
This is a re-write of the program.

It's written entirely in Linux scripting,so it should be easy to
add,remove,edit,for your needs.

You can create and destroy a VPS,and supports both IPv4 and IPv6
networking.

It will automatically configure DEBIAN and REDHAT standard OS
template caches.

I wanted this to be primarily a base,for someone to get started with OpenVZ,but can provide a
level of advanced usage.

Drop the script on any Node server,SSH,and you are set.

Some features have been removed from the version I use,due to
third-party software requirements,but it does require SCREEN,if you want to drop to a terminal
console from OVZAdmin.

This is an alpha version,and some VPS admin features are not complete.(I'm currently in the
middle of IPv4-IPv6 transition,and time is not a premium)

Consider this a "test drive".

I cannot provide screen shots,as I'm using a minimal graphical environment.

Comments good or bad welcomed.

Once I come up with a good release version,I will provide.

My goal is to write a GPL web-based version.
