I have a newer version of OVZAdmin, that is almost where I want it.
It only lacks the finishing touches to VPS Admin(disk quotas,etc), and some additions to Node administration.

For the curious;

1. OVZAdmin, will only run on REDHAT Nodes.(I may add DEBIAN later)
2. Will create,destroy,or create a VPS only.
3. Supports IPv4 and IPv6 virtual Ethernet.
4. Supports IPv4 and IPv6 bridged Ethernet.
5. Supports IPv6 auto-configuration.
6. Builds DEBIAN or REDHAT containers.
7. Has built in VPS configuration database(simple text files to a given directory.(in my final release, it will support MYSQL)
8. Node Administration options are still unavailable, due to third party software requirements.(add your own)

Known issues

1. DEBIAN containers will not auto-config.(I'm not DEB literate, and is based on info provided by sources on NET.)
2. If you use IPv4 containers on same bridge as IPv6 auto, the IPv4 containers will auto-config.(this is a known issue)
I do not want to set "auto-conf" off in a VE, and have to script out its removal, just to add auto-config support in a VE later.
(probably end up doing anyway)

I have screen-shots of OVZAdmin, so that should leave me with one open upload.
