I have a newer version of OVZAdmin, that is almost where I want it. It only lacks the finishing touches to VPS Admin(disk quotas, etc), and some additions to Node administration.

For the curious:

- 1. OVZAdmin, will only run on REDHAT Nodes. (I may add DEBIAN later)
- 2 Will create, destroy, or create a VPS only.
- 3. Supports IPv4 and IPv6 virtual Ethernet.
- 4. Supports IPv4 and IPv6 bridged Ethernet.
- 5. Supports IPv6 auto-configuration.
- 6. Builds DEBIAN or REDHAT containers.
- Has built in VPS configuration database(simple text files to a given directory.(in my final release,it will support MYSQL)
- 8. Node Administration options are still unavailable, due to third party software requirements. (add your own)

Known issues

- 1. DEBIAN containers will not auto-config.(I'm not DEB literate, and is based on info provided by sources on NET.
- 2. If you use IPv4 containers on same bridge as IPv6 auto,the IPv4 containers will auto-config.(this is a known issue)

I do not want to set "auto-conf" off in a VE, and have to script out its removal, just to add auto-config support in a VE later. (probably end up doing anyway)

I have screen-shots of OVZAdmin,so that should leave me with one open upload.
