I have a newer version of OVZAdmin,that is almost where I want it.
It only lacks the finishing touches to VPS Admin(disk quotas,etc),and some additions to Node administration.

For the curious;

1. OVZAdmin,will only run on REDHAT Nodes.(I may add DEBIAN later)
2 Will create,destroy,or create a VPS only.
3. Supports IPv4 and IPv6 virtual Ethernet.
4. Supports IPv4 and IPv6 bridged Ethernet.
5. Supports IPv6 auto-configuration.
6. Builds DEBIAN or REDHAT containers.
7. Has built in VPS configuration database(simple text files to a
   given directory.(in my final release,it will support MYSQL)
8. Node Administration options are still unavailable,due to third
party software requirements.(add your own)

Known issues

1. DEBIAN containers will not auto-config.(I'm not DEB literate,and is based on info provided by sources on NET.

2. If you use IPv4 containers on same bridge as IPv6 auto,the IPv4 containers will auto-config.(this is a known issue)
I do not want to set "auto-conf" off in a VE,and have to script out its removal,just to add auto-config support in a VE later.
(probably end up doing anyway)

I have screen-shots of OVZAdmin,so that should leave me with one
open upload.
