I have a newer version of OVZAdmin.

ovzadmin-pre3

Changes;

1. Slim down code,and got rid of useless verbose prompts.
2. Supports disk-quotas for VE at build time.
3. Changed simple text database default directory to;

`/var/log/vpsdatabase`

If you do not have it,no worries.

4. The default VE config was changed from older version of OVZ,
to reflect newer versions.
A VE config is "unlimited".
5. "GUI" is sleeker.(at least for text)

Right now,I'm going over some submitted coding that looks promising,so it will speed things up a bit.

VE maintenance options are still not complete.

Node Administration will be incorporated with some of the submitted code,and some I found.

You may still want your own.

No screen shots,as the ones posted,gets you in the ball park.
