It's more or less difficult task to move to rhel5 because of application and software dependencies.

for example my client have server in DC (there is long procedure to enter to DC), there runs online shop and it written for php4. so to move this to rhel5 application must by adapted to php5, then i will have to test everything and than try to move with as less as possible downtime.

that's very long way, and we plan to do so in 1 year.

to move to rhel5/rhel6 is very good idea because rhel4 support ends in 2012-02-29  
and of course rhel6 is best approach because rhel5 support ends in 2014-03-31
