Hi all,

I have recently grabbed the OpenSuse 11.3 and 11.4 OpenVZ templates from the openvz wiki template site.

Unfortunately both templates "bomb out" when creating a VZ container because devtmpfs is not available.

There is a small snippet inside the VZ template under /etc/init.d/boot which checks if devtmpfs is available:

```
DTYPE=$(stat -f -c "%T" /dev 2>/dev/null)
if test "$DTYPE" != "tmpfs" ; then
    if test "$HAVE_DEVTMPFS" = "0" ; then
        echo "***** FATAL ERROR *****"
        echo "***** CONFIG_DEVTMPFS missing from kernel, cannot continue..."
        echo "*****"
        /sbin/halt -f
    fi
    echo -n "Mounting devtmpfs at /dev"
    mount -n -t devtmpfs -o mode=0755 devtmpfs /dev
    rc_status -v -r
fi
```

As "workaround" I have disabled this check completely and mounted /dev via tmpfs. There are several warnings when accessing /dev/console from rc_status but beside this the VZ container is starting up at least.

```
DTYPE=$(stat -f -c "%T" /dev 2>/dev/null)
if test "$DTYPE" != "tmpfs" ; then
    #if test "$HAVE_DEVTMPFS" = "0" ; then
    # echo "***** FATAL ERROR *****"
    # echo "***** CONFIG_DEVTMPFS missing from kernel, cannot continue..."
    # echo "*****"
    # /sbin/halt -f
    #fi
    echo -n "Mounting tmpfs at /dev"
    mount -n -t tmpfs -o mode=0755 tmpfs /dev
    rc_status -v -r
fi
```

Since we are using proxmox VE 1.8 as virtualisation platform, our host is running a custom

proxmox-build kernel with OpenVZ and KVM enabled. One of their developer pointed out that there is currently no OpenVZ kernel with DEVTMPFS enabled.

My questions:

- 1) Is it true that devtmpfs and OpenVZ inside the kernel do not play nicely together ?
- 2) Is there a tailored OpenVZ template for OpenSuse at all which works without devtmpfs ?
- 3) Is there a possibility to build a kernel which provides both OpenVZ functionalities as well as devtmpfs support ?

TIA,
Holger
