All of my containers have the problem of "no more ptys" when I try to issue the screen command as a user, with root there is no problem.

I done some digging on google and found when I execute this command in the container "mount -t devpts /dev/ptmx /dev/pts" the problem disappears until the next reboot.

The kernel is 2.6.18-238.12.1.el5.028stab091.1 with the containers operating system being ubuntu 10.10

Is there anyway to fix this problem?
