Subject: ovz-web-panel, change FDQN before installation?
Posted by Fredrik-s on Mon, 11 Jul 2011 08:55:49 GMT

Hello,

I'm trying to install ovz-web-panel on Debian 6.0 64-bit.

I have installed all the necessary components:

 Ruby 1.8.5+ (1.9 is not supported)
 RubyGems
 Ruby SQLite3 support

But after installation of ovz-web-panel through the command:
[i]wget -O - http[I-cannot-use-links-yet]://ovz-web-panel.googlecode.com/svn/installer/ai.sh | sh[/i]

It tells me that the login adress to my control panel is http[I-cannot-use-links-yet]://myserver:3000 and not http[I-cannot-use-links-yet]://myip:3000

Is it necessary to change FDQN before installation in /etc/hosts? And if it is, what should I change to. I'm pretty new to all this, so I'm a little bit confused.

Greetings
