
Subject: Reduce Load in VZs

Hello,

We have on our Server about 17VZs installed and running. Most of them run similar cron jobs, e.g. apticron and this causes very high load at night.

Is there any best practise that we can use to reduce the load with these jobs? I thought about running these cronjobs from outside with vzctl exec (so make a cron at the host and just start the programmes manually) and run only 1 job at once.

In general: Is there a best practise to run things in every VZ and not produce high load?

Thanks!

greetings
