Hi,

naro wrote on Tue, 15 March 2011 08:58I solved my problem by modifying ARP table on HN:

```
arp -i eth0 -Ds YYY.132.159.194 eth0 pub
```

YYY.132.159.194 is IP address of my container.

I wrote a vps.mount/vps.umount hook scripts which adds record to the arp table on VPS start and removes it on VPS shutdown. Works fine for all containers (the script reads particular IP from IP_ADDRESS environment variable).

can you please show the OpenVZ config option NEIGHBOUR_DEVS

```
% grep NEIGHBOUR_DEVS /etc/vz/vz.conf
```

Bye,
Thorsten
