I don't think vldump works very well on CentOS 6. The creators test it only for Debian. Here an example:

<http://forum.proxmox.com/threads/6857-vldump-snapshot-works-but-suspend-fails>

If you are able to shutdown the container for a minute you could also do an easy LVM snapshot. Which is probably better, since vldump backups are not 100% safe anyway.
