I think this might be the similar to what I have seen on my server node with centos 6 2.6.32-042stab031.1 kernel when the server crashed twice in about 2 weeks. Same mention of migration issue in /var/log/messages with process getting stuck in single CPU for 67 seconds and causes crash.

kernel: [633492.036001] BUG: soft lockup - CPU#0 stuck for 67s! [migration/0:3]
