---

So, this time when the module is loaded there is no more "Unable to add IP 192.168.2.1: Inappropriate ioctl for device" error. So make sure this module is loaded.

This time there is no error, but a warning: "veth feature is not supported by kernel, skipped veth configure". If you really need veth functionality, check that vzethdev module is loaded:  
lsmod | grep vzeth

If it is not loaded, load it.

PS You might want to check /etc/init.d/vz and make sure vznetdev (and vzethdev -- if you need it) are in.
