
Subject: Benefits of upgrading to RHEL6 OVZ kernel?

Seeing as there has already been some kernel panic problems with the RHEL6 OVZ kernel I am in no hurry to upgrade production servers.

Having said that, are there any compelling reasons to upgrade sooner rather than later? I am aware of the different way that cpu resources are load balanced and VZswap feature. I am just curious what sort of real world performance improvement people are experiencing. Any improvement in I/O? My bottleneck problems are all I/O related and any improvement there would be compelling for me.

PS: OpenVZ Rocks!
