This sounds like the same problem I had when I recently moved some old
Gentoo-containers from Linux-Vserver to OpenVZ.

Try the following command:
vzctl exec CTID mount -t devpts none /dev/pts
then try to reenter:
vzctl enter CTID

If this works, then all you have to do is add the line "mount -t
devpts none /dev/pts" to the container's /etc/rc.local to make sure it
stays working after a restart. There may be more elegant solutions out
there, but this works for me.

Cheers,
Einar
