Good morning / afternoon,

I have followed the tutorial for installation and managed to get the kernal installed aswell as other openvz yum utilities and also installed solusvm for management.

The issue i am having is with forwarding the ip to the container, solusvm is setting the ip to the container but the traffic from the www (world) isnt getting passed to the container.

What do you need to help me and what do i need to setup to get this working.

Regards,

G
