Hi, I need for a personnal project to mount a CIFS file system on a container. I know there is a way by sharing a ressource CIFS with mount --bind on the host but I can't use it.

I maid a Vpn on my container and I need to access on the vpn user machines in my container too. The problem is the CIFS module is not virtualised yet so I can't use it.

Did this module will be virtualised and when ? There is some other solutions ?

Thanks a lot
